Calculating BMI
(Non-Metric Conversion)

To calculate BMI using non-metric units, use this formula:

\[
\text{BMI} = \frac{\text{weight (pounds)}}{\text{height squared (in.²)}} \times 703
\]

For Example, a person who weighs 164 pounds and is 68 inches (or 5 feet 8 inches) tall has a BMI of 25:

\[
\frac{164}{68^2} \times 703 = 25
\]
